1 How to use LDA

1.1 things to install before

1. VS2010 . I translate the code into a vs project. You should install Microsoft Visual Studio 2010 or you can build you own project based on other compiler.
2. Notepad++. You'd better use it to view the source and destination file for Linux file opened in windows will have no newline.
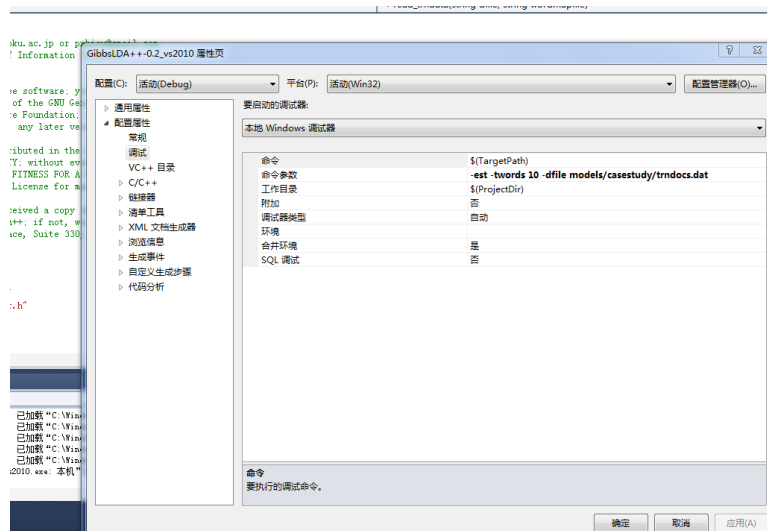

1.2 how to start

Open the project and you will see this:

The main function is in the lda.cpp.
And you can add parameter like this, add them in the parameter:

You should read the manual.pdf for how to write command.
Then you can build and run the program.

2   Write in the last

If you have any questions, please email me:
